Troubleshooting Common Issues

Even with proper maintenance, operators may encounter issues while using the Dornier loom. The manual provides troubleshooting guidelines for common problems, such as:

1. Yarn Breakage

If yarn breakage occurs frequently, consider the following:

- Check for knots or defects in the yarn.
- Ensure proper tension is maintained on the warp beam.
- Inspect the reed and heddles for damage.

2. Fabric Defects

Fabric defects can arise from several factors:

- Verify that the yarn is loaded correctly and there are no tangles.
- Check the loom settings to ensure they align with the fabric specifications.
- Inspect the take-up mechanism for proper functioning.

3. Machine Stalling

If the loom stalls during operation, the manual suggests:

- Inspecting the power supply for any interruptions.
- Checking for blockages in the weaving mechanism.
- Ensuring that emergency stop buttons are not engaged.

Parts Identification and Replacement

The manual includes a section on parts identification, which is essential for ordering replacements

and conducting repairs. Common parts that may need replacement include:

- Shuttles: The component that carries the weft yarn through the warp threads.
- Reeds: Used to separate the warp threads and push the weft yarn into place.
- Heddles: Control the position of the warp threads during weaving.

Ordering Replacement Parts

When ordering replacement parts, operators should:

1. Refer to the parts list in the manual for the correct part numbers.
