Frequently Asked Questions

How does a microwave heat food?

A microwave heats food by emitting microwaves, which are a form of electromagnetic radiation. These microwaves agitate water molecules in the food, causing them to vibrate rapidly and generate heat, which warms the food.

What causes the sky to appear blue?

The sky appears blue due to a phenomenon called Rayleigh scattering. When sunlight enters the Earth's atmosphere, it collides with air molecules, scattering shorter blue wavelengths more than the longer red wavelengths.

How do vaccines work?

Vaccines work by introducing a harmless component of a pathogen (like a protein or inactivated virus) into the body, prompting the immune system to produce antibodies and train immune cells to recognize and fight the real pathogen in the future.

Why do we dream?

Dreaming is thought to be a way for the brain to process information, emotions, and experiences. Some theories suggest that dreams help with memory consolidation, problem-solving, and emotional regulation.

How do plants convert sunlight into energy?

Plants convert sunlight into energy through a process called photosynthesis. They use chlorophyll in their leaves to capture sunlight, which then helps convert carbon dioxide from the air and water from the soil into glucose and oxygen.

What makes a rainbow?

A rainbow is created when sunlight is refracted, reflected, and dispersed in water droplets in the atmosphere. The light bends at different angles, separating into its component colors, which appear as a circular arc in the sky.

How does the internet work?

The internet works by using a network of servers and clients that communicate via protocols. Data is sent in packets through various routes, using cables, satellites, and wireless signals, allowing devices to connect and share information globally.

What is the science behind gravity?

Gravity is a fundamental force that attracts two bodies toward each other, proportional to their masses and inversely proportional to the square of the distance between them. It is described by Newton's law of universal gravitation and Einstein's theory of general relativity.

How do airplanes fly?

Airplanes fly by generating lift through their wings. When air flows over the wings, the shape and angle create a difference in air pressure, resulting in lift. Thrust from engines propels the airplane forward, while control surfaces manage direction.
