Getting Started with SageMath

Once installed, you can start using SageMath to perform various computations. The interface resembles a Jupyter Notebook, allowing you to enter code in cells and see results immediately.

Basic Operations

To perform basic operations in SageMath, you can use standard Python syntax along with Sage's

mathematical functions. Here are some examples:

1. Arithmetic Operations:

```
```python
a = 5
b = 10
c = a + b
print(c) Output: 15
```
```

2. Symbolic Computations:

```
```python
x = var('x')
expr = x^2 + 3x + 2
factor(expr) Output: (x + 1)(x + 2)
```
```

3. Solving Equations:

```
```python
solve(expr == 0, x) Output: [x == -1, x == -2]
```
```

4. Plotting Functions:

```
```python
plot(sin(x), (x, -2pi, 2pi))
```
```

Data Structures

SageMath supports various data structures such as lists, sets, and dictionaries. Here's how to use them:

- Lists:

```
```python
my_list = [1, 2, 3, 4, 5]
print(my_list[0]) Output: 1
```
```

- Sets:

```
```python
my_set = {1, 2, 3, 4, 5}
my_set.add(6) Adding an element
```
```

- Dictionaries:

```
```python
my_dict = {'a': 1, 'b': 2}
print(my_dict['a']) Output: 1
```
```

Advanced Functionalities

SageMath is not just for simple calculations; it also provides advanced functionalities for complex mathematical tasks.

1. Algebra

SageMath excels in algebraic computations, including polynomial ring operations, matrix manipulations, and group theory.

- Polynomial Rings:

```
```python
R. = PolynomialRing(QQ)
f = x^2 + 3x + 2
```
```

- Matrices:

```
```python
A = Matrix([[1, 2], [3, 4]])
A.eigenvalues() Output: [5, -1]
```
```

2. Calculus

You can also perform calculus operations such as differentiation and integration.

- Differentiation:

```
```python
f = x^2 + 3x + 2
diff(f, x) Output: 2x + 3
```
```

- Integration:

```
```python
integral(f, x) Output: (1/3)x^3 + (3/2)x^2 + 2x + C
```
```

3. Graph Theory

SageMath provides robust tools for working with graphs and networks.

- Creating a Graph:

```
```python
G = Graph({0: [1, 2], 1: [2, 3], 2: [3]})
```
```

G.plot() Visualize the graph

```
```
```

## 4. Visualization

SageMath has built-in tools for creating various types of plots and visualizations.

- 2D Plots:

```
```python
plot(x^2, (x, -5, 5))
```
```
