Key Topics and Example Problems

Understanding the answer key is more effective when students are familiar with the types of problems they will encounter in Unit 3. Below are some key topics along with example problems and their solutions.

1. Polynomial Functions

- Example Problem: Factor the polynomial $(x^2 - 5x + 6)$.

- Solution: The factors of 6 that add up to -5 are -2 and -3. Therefore, $(x^2 - 5x + 6 = (x - 2)(x - 3))$.
- Example Problem: Determine the end behavior of $(f(x) = -2x^3 + 4x^2 - x + 1)$.
- Solution: Since the leading term is $(-2x^3)$, as (x) approaches infinity, $(f(x))$ approaches negative infinity, and as (x) approaches negative infinity, $(f(x))$ approaches positive infinity.

2. Rational Expressions and Equations

- Example Problem: Simplify the expression $(\frac{x^2 - 1}{x^2 - 4})$.
- Solution: The expression can be factored: $(\frac{(x - 1)(x + 1)}{(x - 2)(x + 2)})$. There are no common factors to simplify further.
- Example Problem: Solve the equation $(\frac{x + 3}{x - 1} = 2)$.
- Solution: Cross-multiplying gives $(x + 3 = 2(x - 1))$. Expanding and solving leads to $(x + 3 = 2x - 2)$, which simplifies to $(x = 5)$.

3. Systems of Equations

- Example Problem: Solve the system of equations:
 - $(2x + 3y = 6)$
 - $(x - y = 1)$
- Solution: From the second equation, $(x = y + 1)$. Substituting into the first equation gives $(2(y + 1) + 3y = 6)$, leading to $(5y + 2 = 6)$ or $(y = \frac{4}{5})$. Substituting back, $(x = \frac{9}{5})$.
