4. Normally Closed (NC): The output connection that is closed when the relay is not energized

The typical pin layout for the JD1912 relay is as follows:

- Pin 1: A1 (Coil +)
- Pin 2: A2 (Coil -)
- Pin 3: NO (Normally Open)
- Pin 4: NC (Normally Closed)
- Pin 5: COM (Common)
- Pin 6: Not connected
- Pin 7: Not connected
- Pin 8: Ground or common return

Wiring the JD1912 Relay

Wiring the JD1912 relay involves connecting it to an external power source and load. Follow these steps for a successful setup:

1. Gather Required Tools and Materials:
 - JD1912 relay
 - DC power supply (12V)
 - Multimeter
 - Soldering iron and solder (if necessary)
 - Wires and connectors
2. Identify the Components:
 - Determine the power source and load you intend to control with the relay.
3. Connect the Relay:
 - Connect the Coil:
 - Connect Pin 1 (A1) to the positive terminal of the 12V power supply.
 - Connect Pin 2 (A2) to the negative terminal of the power supply.

- Connect the Load:
 - Connect one terminal of the load (e.g., a light or motor) to Pin 5 (COM).
 - Connect the other terminal of the load to the appropriate power source (usually the negative side).
 - If using the Normally Open contact, connect the load to Pin 3 (NO). If using Normally Closed, connect to Pin 4 (NC).
4. Final Checks:
- Double-check all connections for correctness and security.
 - Use a multimeter to verify continuity and check for any shorts.
5. Testing the Relay:
- Power on the system and activate the relay to ensure it switches correctly.
