Navigational Aids Included in the Jeppesen Airway Manual

The Jeppesen Airway Manual includes a variety of navigational aids that are crucial for

flight operations. Understanding these aids is essential for pilots to navigate effectively.

1. VOR (VHF Omnidirectional Range)

VOR stations are ground-based radio navigational aids that provide azimuth information to pilots. The Jeppesen Airway Manual includes information about VOR stations, including their frequencies and geographic locations, enabling pilots to determine their position relative to these aids.

2. NDB (Non-Directional Beacon)

NDBs are another form of navigational aid that transmits radio signals. Pilots can use the signals from NDBs to determine their bearing and navigate towards or away from the beacon. The manual provides essential details about the locations and frequencies of NDBs across North America.

3. Waypoints

Waypoints are predetermined geographic locations that pilots use for navigation. The Jeppesen Airway Manual lists standard waypoints, which are often used in conjunction with airways to define flight routes. This simplifies navigation and helps in managing air traffic.

4. RNAV (Area Navigation)

RNAV systems allow pilots to fly more direct routes by using waypoints rather than traditional airways. The Jeppesen Airway Manual includes information about RNAV procedures, including performance requirements and specific routes available for RNAV-equipped aircraft.

Accessing the Jeppesen Airway Manual

Accessing the Jeppesen Airway Manual has become easier in recent years due to advancements in technology. Pilots can choose from several formats:
