This might involve checking specific components, verifying settings, or listening for unusual noises. Being familiar with this section can save you considerable time and expense when unexpected issues arise in the field.

Bale Formation Problems

Issues such as unevenly formed bales, bales that fail to form properly, or bales that do not eject correctly are common. The John Deere 335 round baler manual will address these specific problems, suggesting checks related to bale tension adjustments, pickup performance, and the proper functioning of the core-forming mechanism. It may also advise on checking for blockages within the bale chamber or issues with the feeding augers.

Wrapping and Tying Failures

Failures in the wrapping or tying system, such as twine not cutting, net wrap not feeding correctly, or knots not forming, can be frustrating. The manual provides troubleshooting steps for these issues, which might involve inspecting the twine or net threading, checking the tension arm, verifying the twine disk or net wrap cutter operation, and ensuring the knotter or wrapping mechanism is clean and free of debris. Corrective actions for a faulty twine arm will be clearly outlined.

Drive System and Power Issues

Problems related to the baler's drive system, such as a PTO driveline that is not engaging or a chain that is slipping, are also covered. The John Deere 335 round baler manual will guide you on checking PTO shaft alignment, verifying universal joint condition, inspecting drive chains for proper tension and lubrication, and examining sprockets for wear. It will also address potential issues with the baler's own internal drive mechanisms.
